

# **What You Don't Know You Don't Know About (Hot) Water**

**2019 RESNET Conference  
New Orleans**

Gary Klein, President  
Gary Klein and Associates, Inc.  
Rancho Cordova, CA 95742  
[gary@garykleinassociates.com](mailto:gary@garykleinassociates.com)  
916-549-7080

# Goal of this Session:

- Identify at least 5 things you didn't know you didn't know about (hot) water
- Any specific topics you want me to address?
- Are you ready?

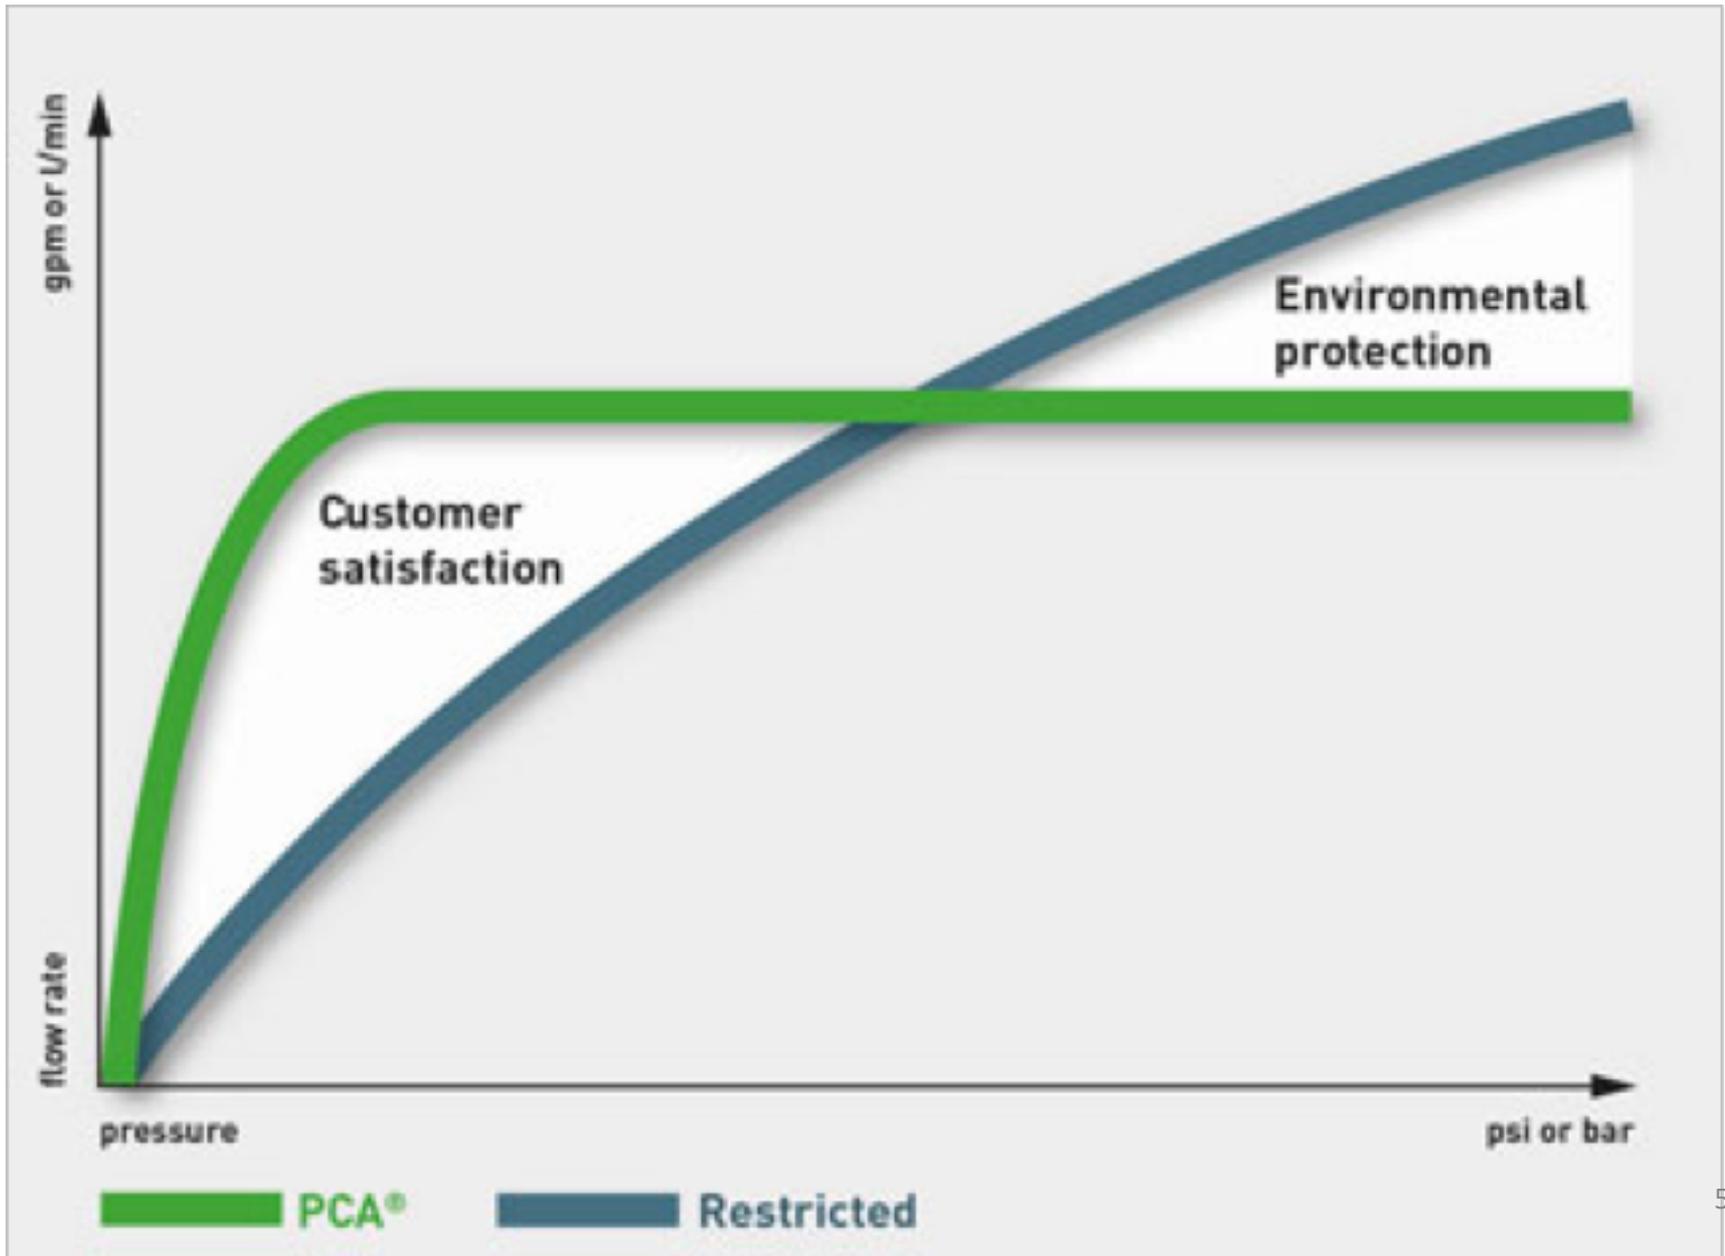

# 1. Water Heaters Have Air Filters

- Well, not all of them, but a very large and growing percentage
- Atmospheric Gas-fired Storage Heaters
  - Flammable Vapor Ignition Resistance (FVIR)
    - Closed combustion chamber, screen with tiny air holes, easily clogged with dust and lint
    - Large particle screen surrounds the bottom of the heater
- Electric Heat Pump Water Heaters
  - Filter on the inlet side of the air path through the heat pump coils.
- Filters need to be cleaned regularly!

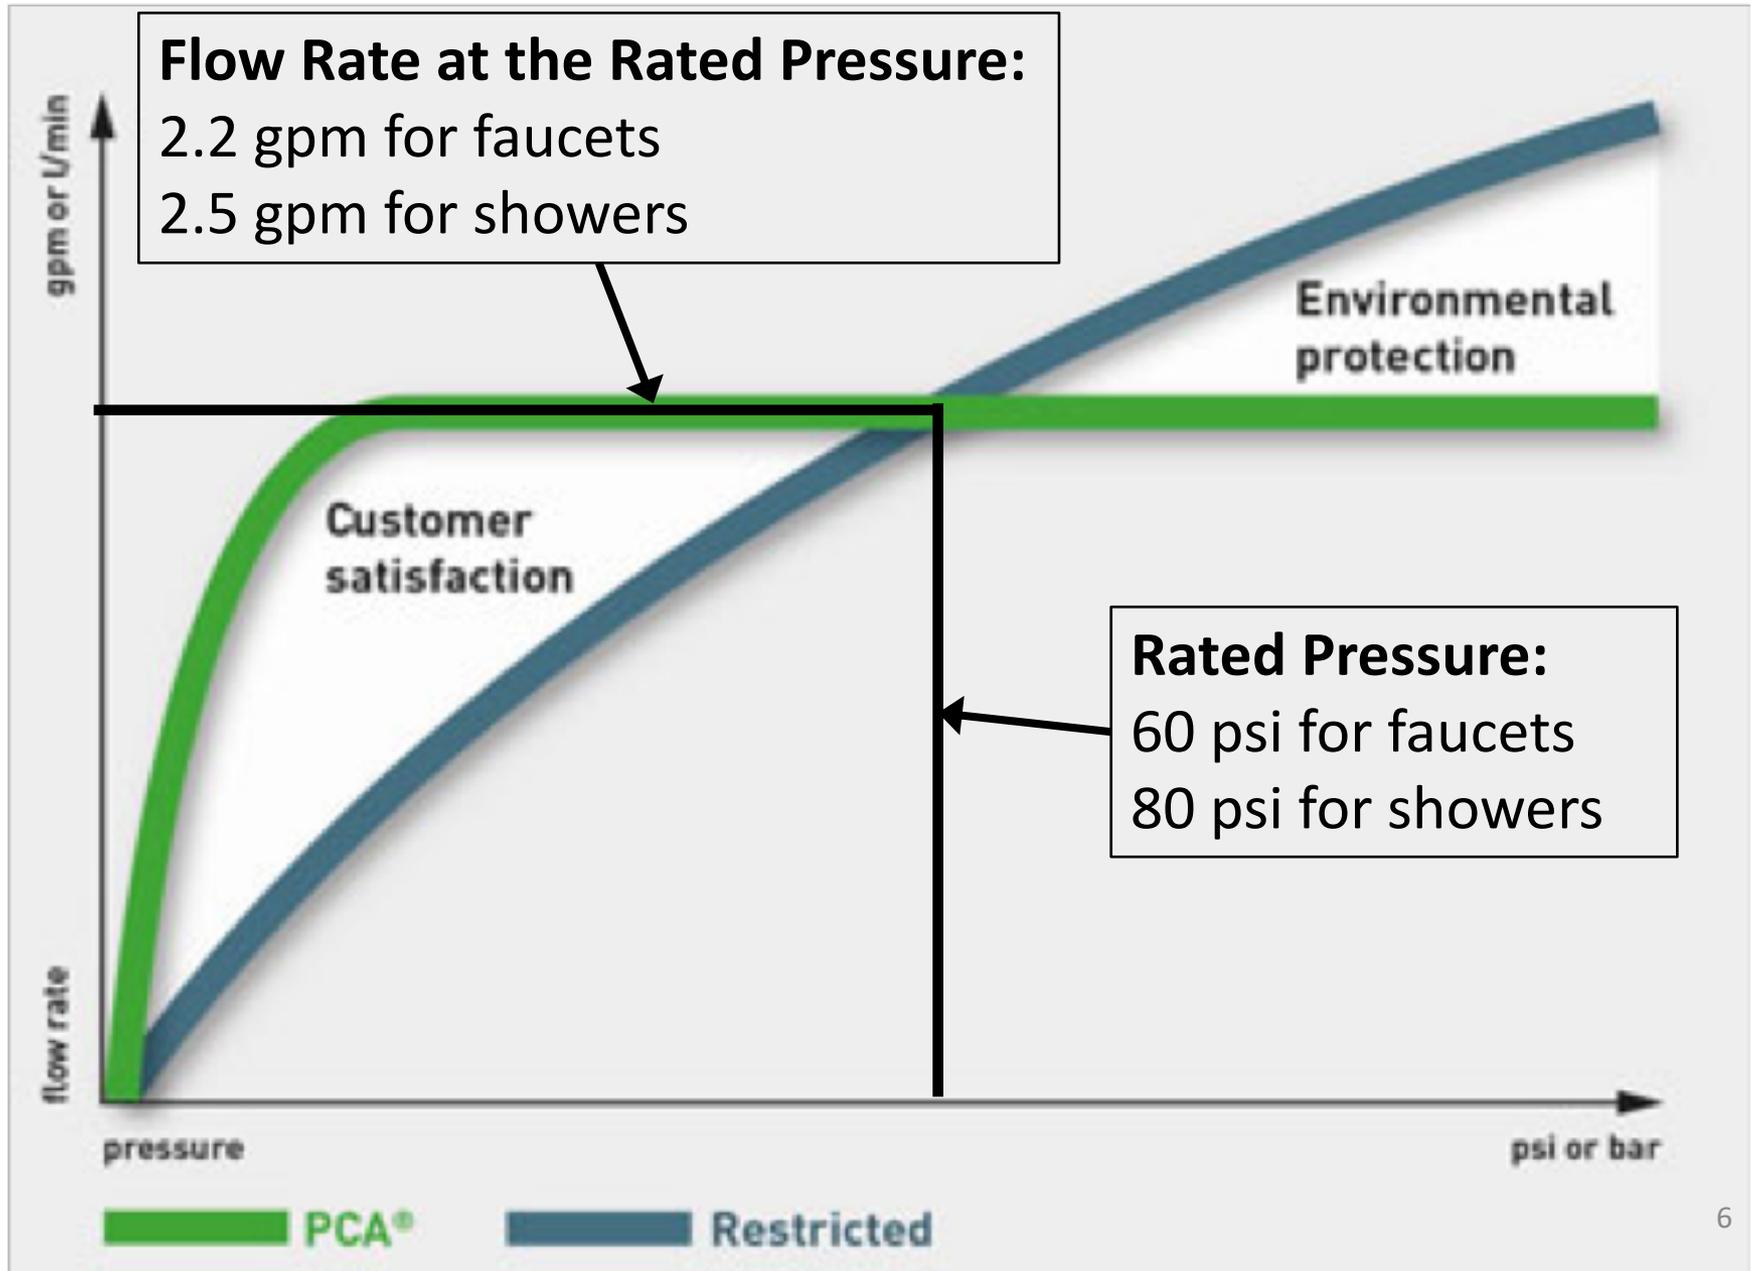

# 2. Fixed vs. Variable Orifices

- **Fixed Orifice:**
  - High pressure: High flow rate
  - Low pressure: Low flow rate
  - Before 2000, practically all fixture fittings and appliances
- **Pressure Compensating Aerators**
  - Adjusts flow rate to compensate for available pressure
  - Almost the same flow rate for all pressures above 20-25 psi
  - Ramped up from 2000-2012 for showerheads
  - Today more than 90% and many faucet aerators

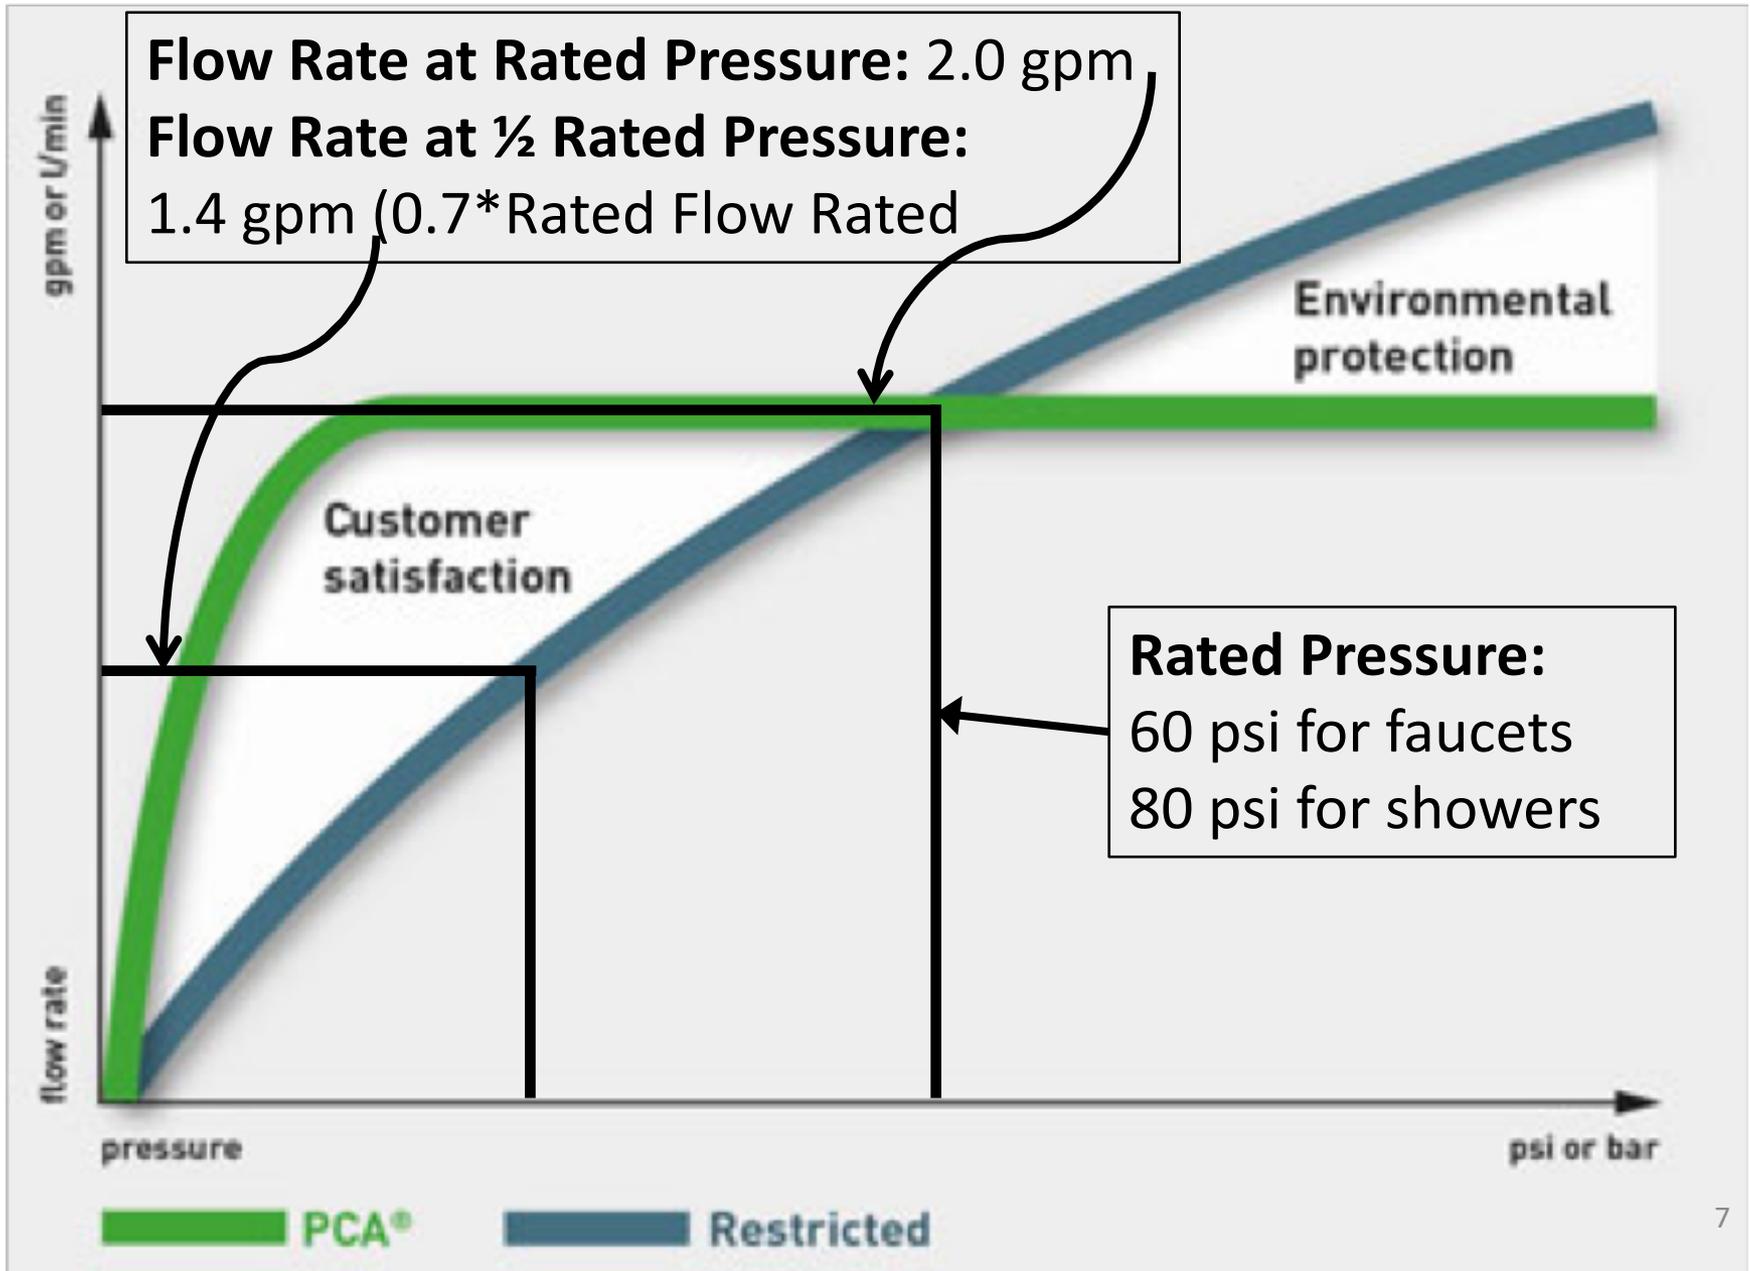

# Pressure Compensating Aerators - 1

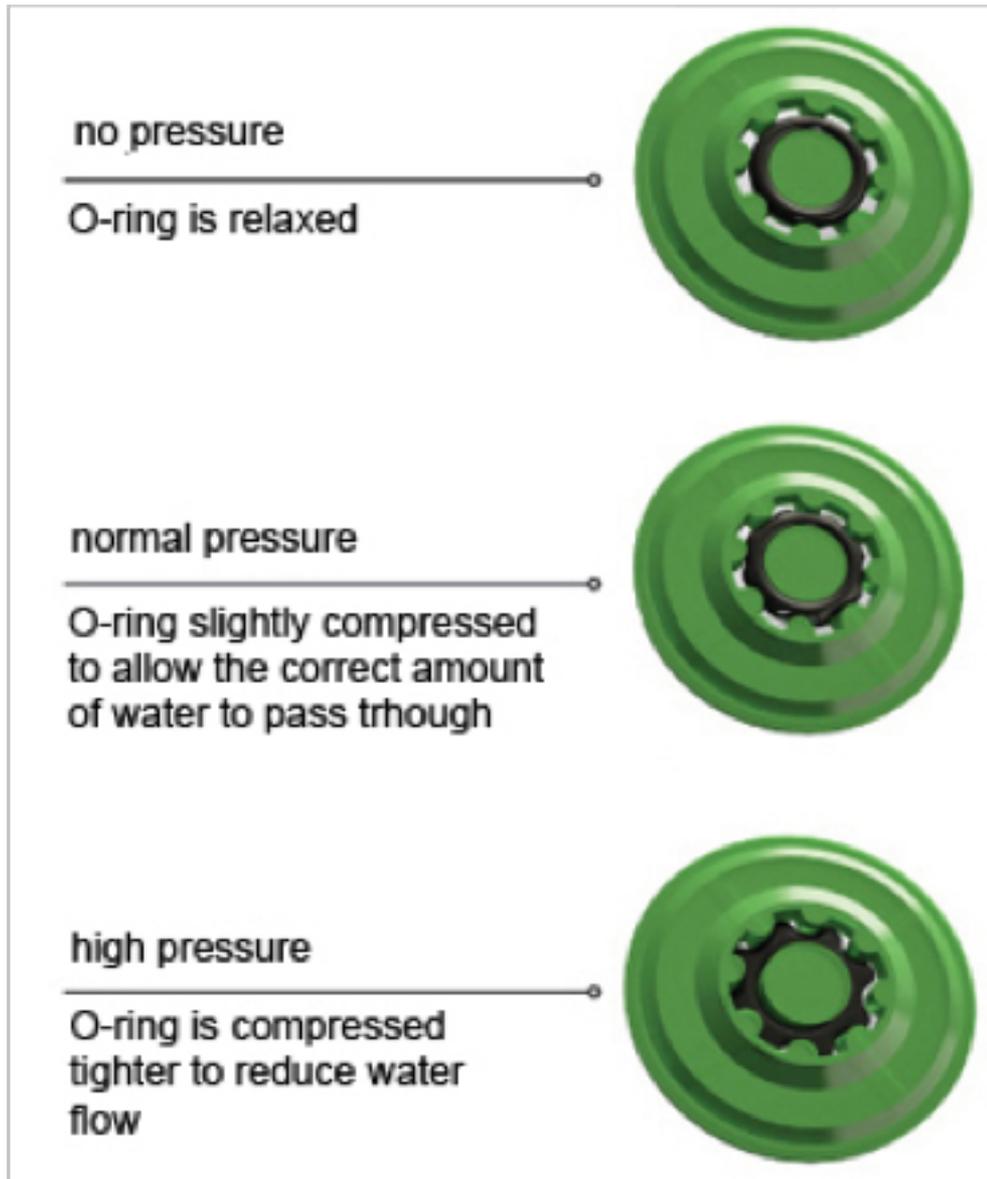

# Pressure Compensating Aerators - 2

# Pressure Compensating Aerators - 3

# Pressure Compensating Aerators - 4

A pressure compensating flow regulator maintains a constant flow regardless of variations in line pressure thereby optimizing system performance and comfort of use at all pressures.

*Source: Neoperl's website for this and the pressure-flow diagrams*

# 3. (Hot) Water Flow in Buildings

- What percent of the time does water flow through the meter into the building?
  - Most normal condition is off – zero flow!
    - Depending on occupancy, more than 96% of the time
  - 2<sup>nd</sup> most normal is 1 fixture fitting or appliance
    - Probably cold, say a toilet
    - Of the remaining 4%, this happens more than 3.9% of the time
    - Hot water is roughly half of this.
  - Flows greater than 3 gpm occur less than 0.1% of the time

# 3. (Hot) Water Flow in Buildings (cont.)

- Pipe sizing rules were written down in the 1940s
  - Pressure and temperature balanced shower valves became widely available in the 1980s
  - Pressure compensating orifices became widely available in the 2010s
- These two devices mitigate many of this issues that occurred with peak flow rates
  - Relatively constant, safe flow rates for showers and faucets
  - Little impact on the fill rates for toilets, tubs and machines.
- Let's use these technologies to help with revising the rules for pipe sizing.

# Water Consumption 1980-2017

Water-using Fixture or Appliance	1980s Water Use (typical)	1990 Requirement (maximum)	EPAct 1992 Requirement (maximum)	2009 Baseline Plumbing Code (maximum)	"Green Code" Maximums (2017 CALGreen)	% Reduction in avg water use since 1980s
<b>Residential Bathroom Lavatory Faucet</b>	3.5+ gpm	2.5 gpm	2.2 gpm	2.2 gpm	1.2 gpm	66%
<b>Showerhead</b>	3.5+ gpm	3.5 gpm	2.5 gpm	2.5 gpm	1.8 gpm	49%
<b>Residential ("private") Toilet</b>	5.0+ gpf	3.5 gpf	1.6 gpf	1.6 gpf	1.28 gpf	74%
<b>Commercial ("public") Toilet</b>	5.0+ gpf	3.5 gpf	1.6 gpf	1.6 gpf	1.28 gpf	74%
<b>Urinal</b>	1.5 to 3.0+ gpf	1.5 to 3.0+ gpf	1.0 gpf	1.0 gpf	0.125 gpf	96%
<b>Commercial Lavatory Faucet</b>	3.5+ gpm	2.5 gpm	2.2 gpm	0.5 gpm	0.5 gpm	86%
<b>Food Service Pre-Rinse Spray Valve</b>	5.0+ gpm	No requirement	1.6 gpm (EPAct 2005)	No requirement	1.3 gpm	74%
<b>Residential Clothes Washing Machine</b>	51 gallons per load	No requirement	26 gallons per load (2012 std)	No requirement	12.6 gallons per load (Energy Star)	75%
<b>Residential Dishwasher</b>	14 gallons per cycle	No requirement	6.5 gallons per cycle (2012 std)	No requirement	3.5 gallons per cycle (Energy Star)	75%

**From 1980 to 2017: Reductions range from 49 to 96%**

# Right-size the Supply Piping

## 2018 IAPMO Uniform Plumbing Code (UPC)

- Appendix M, Peak Water Demand Calculator
- Single- and multi-family homes with water-conserving plumbing fixtures, fixture fittings and appliances
- In general, can expect reduction of one nominal diameter.
  - Going smaller than 0.5 inch nominal?
  - Pay attention to velocity and residual pressure
- <http://www.iapmo.org/water-demand-calculator/>

# 4. Time-to-Tap and Volume-until-Hot

- More water than is in a pipe comes out of it before hot water arrives. How much more?
  - Carl Hiller measured this in the early 2000s for 3/8 to 3/4 inch copper, CPVC and PEX piping
  - Zhang recently reviewed the data and has found that for flow rates of 0.5 to 2 gpm in 3/4 inch pipe, 1.5-2.5 times the pipe volume comes out before hot water (>105F) comes out the other end. Roughly 2:1.
- Conclusion: if you want hot water to arrive within 10 seconds, make sure there is no more than 5 seconds of volume in the pipe between the source of hot water and the use.

# How Long Should We Wait?

Volume in the Pipe (ounces)	<u>Minimum</u> Time-to-Tap (seconds) at Selected Flow Rates					
	0.25 gpm	0.5 gpm	1 gpm	1.5 gpm	2 gpm	2.5 gpm
2	4	1.9	0.9	0.6	0.5	0.4
4	8	4	1.9	1.3	0.9	0.8
8	15	8	4	2.5	1.9	1.5
16	30	15	8	5	4	3
24	45	23	11	8	6	5
32	60	30	15	10	8	6
64	120	60	30	20	15	12
128	240	120	60	40	30	24

***Cut the volume in half to get these times!***

## ASPE Time-to-Tap Performance Criteria

	<b>Acceptable Performance</b>	1 – 10 seconds
	<b>Marginal Performance</b>	11 – 30 seconds
	<b>Unacceptable Performance</b>	31+ seconds

# 5. Pressure Drop Through Pipe and Fittings

- Many materials and types of fittings
- Calculations vs. measured data
- Are the data we use representative of present day materials and fittings?

## ***From the current ASHRAE Fundamentals Pipe Sizing chapter***

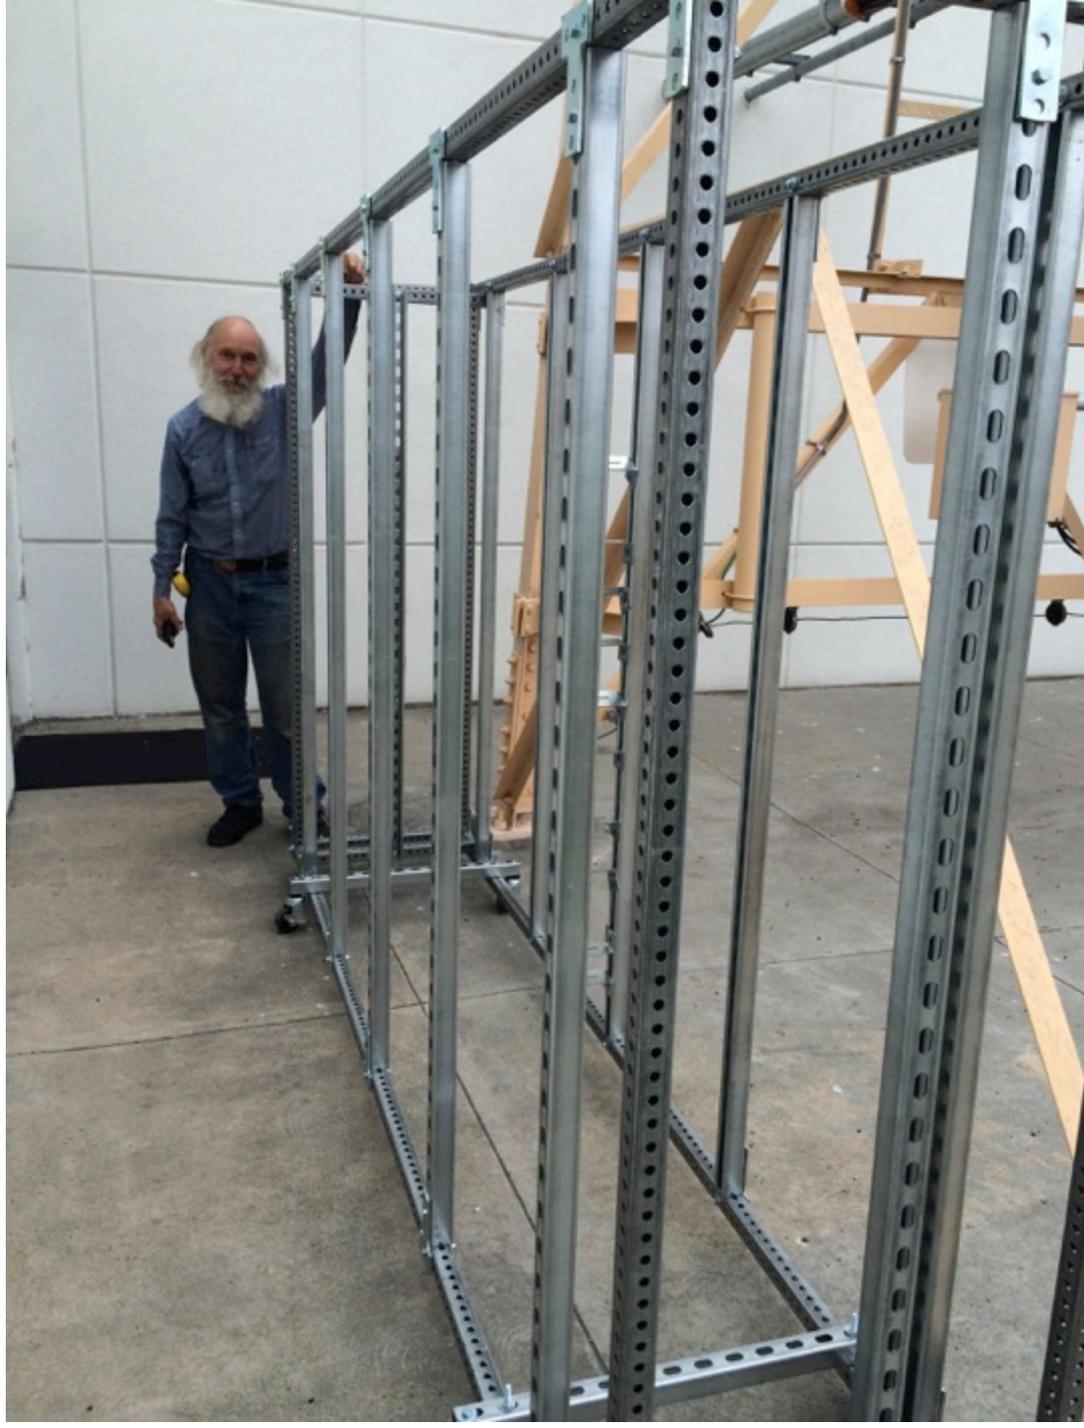

- *Hegberg (1995) and Rahmeyer (1999a, 1999b) discuss the origins of some of the data shown in Tables 4 and Table 5.*
- *The Hydraulic Institute (1990) data appear to have come from Freeman (1941), work that was actually performed in 1895.*
- *The work of Giesecke (1926) and Giesecke and Badgett (1931, 1932a, 1932b) may not be representative of current materials.*

# Pressure Drop - 1

- Elbows widely spaced and close together
- Velocities from 1-12 feet per second
- So far, we have not yet measured any published numbers
  - Are our measurements higher or lower than what is published? Yes!
  - Do our numbers have the same trends as what is published? No!
- It matters if we want to right-size piping systems.

# Pressure Drop Summary

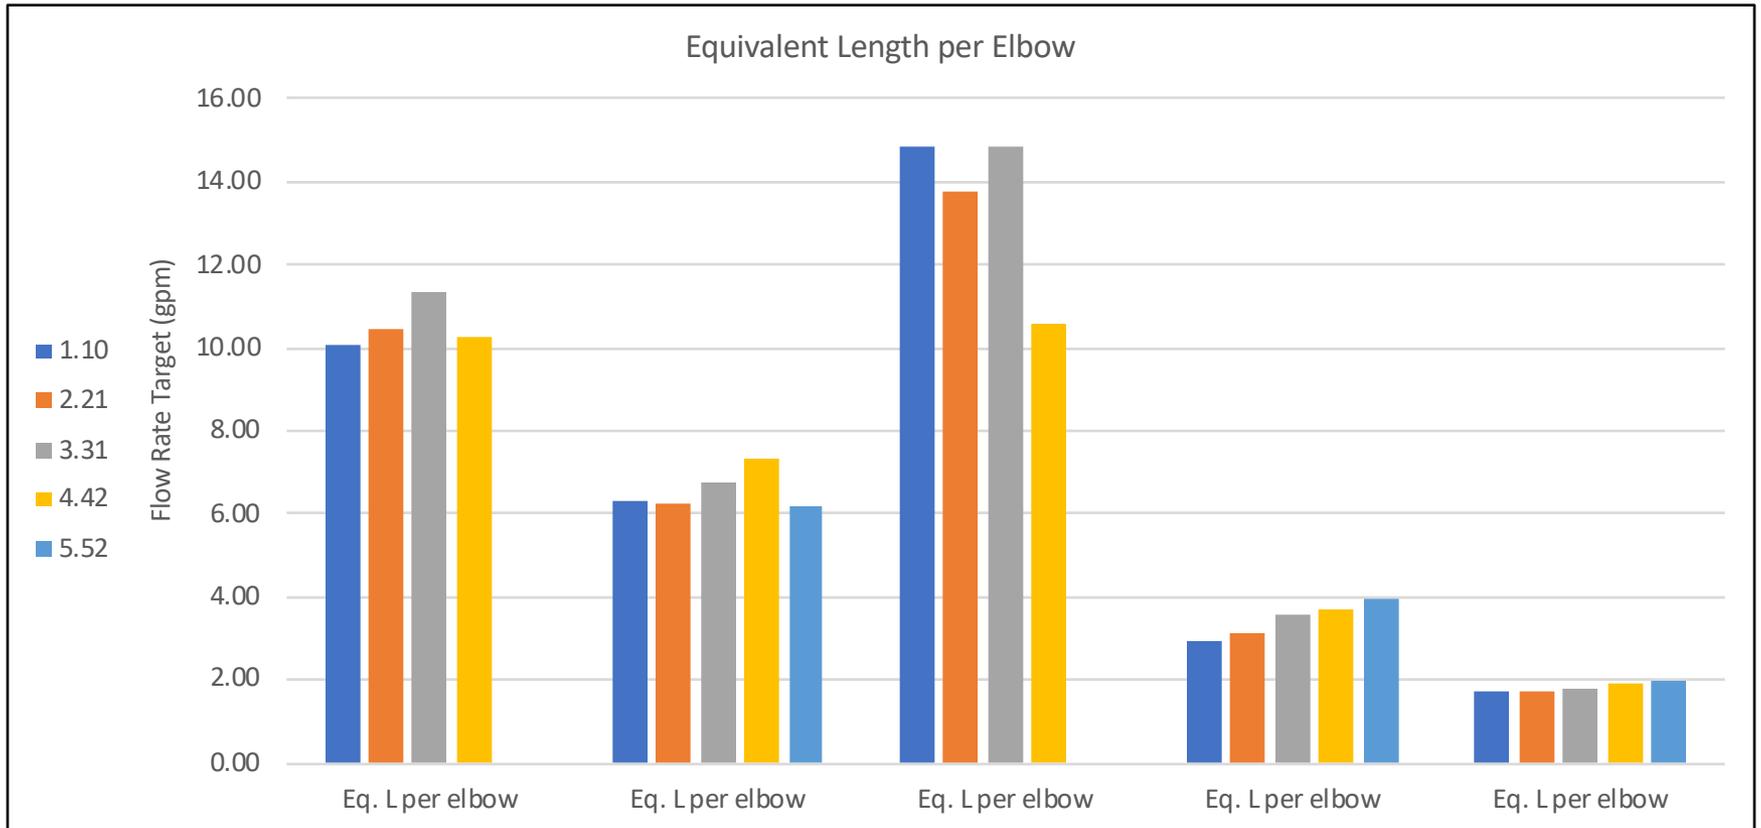

Didn't have enough available pressure to run 10 fps test

# Pressure Drop per Elbow (PSI)

# Equivalent Feet per Elbow (feet)

# Pressure Drop - 2

- Is there a minimum radius of curvature through which there is no additional pressure drop other than that due to the length of the bend?
- Wouldn't that be the most water, pressure, energy and time efficient bend?
- Ask me about the Swoop<sup>®</sup>

# 6. Viscosity of Hot and Cold Water

- What is the viscosity of hot water compared to cold water?
  - Is the difference small or large?
  - Cold water is 1.7-2.8 times more viscous than hot water for a wide range of temperatures typically found in buildings!
- It is almost as though there are 2 different fluids moving through the same pipe.
  - Slippery hot water and sluggish cold water.
  - This helps explain much of the extra volume and time to get hot water from the source to the use.

# Ratio of the viscosity of water at a range of typical temperatures

<b>Cold:Hot</b>	<b>50:120</b>	<b>50:140</b>	<b>70:120</b>	<b>70:140</b>

# 7. Converting Volume to Height

Most of us are between 5'– 7' tall. This means we are roughly equal to:

- 1/8" pipe: 1 shot of liquor (1 ounce)
- 1/4" pipe: A "double" of liquor (2 ounces)
- 3/8" pipe: 1 glass of wine (4-6 ounces)
- 1/2" pipe: 1 cup of water (8 ounces)
- 3/4" pipe: 1 pint of beer (16 ounces)
- 1" pipe: 1 bottle of wine (750 ml)

# Length of Pipe that Holds 8 oz of Water

	<b>3/8" CTS</b>	<b>1/2" CTS</b>	<b>3/4" CTS</b>	<b>1" CTS</b>
	<b>ft/cup</b>	<b>ft/cup</b>	<b>ft/cup</b>	<b>ft/cup</b>
<b>"K" copper</b>	9.48	5.52	2.76	1.55
<b>"L" copper</b>	7.92	5.16	2.49	1.46
<b>"M" copper</b>	7.57	4.73	2.33	1.38
<b>CPVC</b>	N/A	6.41	3.00	1.81
<b>PEX</b>	12.09	6.62	3.34	2.02

# Questions?

**Given human nature,  
it is our job  
to provide the infrastructure  
that supports efficient behaviors.**
